Early Observations from Q1 2023 Earnings Season

Results from Q1 2023 earnings season are arguably carrying extra weight for investors, as many try to gauge how higher interest rates and bank stress may have combined to impact profits in the first three months. As I write, it’s still too early in the reporting season to draw sweeping conclusions. But I do think it’s fair to say that any narratives about an ‘earnings cliff’ can be safely set aside. It’s just not happening.¹

As my colleague and the Director of Research at Zacks, Sheraz Mian, put it: “The picture emerging at this early stage is one of resilience and stability, with an above-average proportion of companies beating estimates and providing a good-enough outlook in an uncertain macro environment.”²

Indeed, 77% of the approximately 90 reporting S&P 500 companies have beaten earnings expectations, which marks a higher beat percentage for these specific companies than in each of the previous three quarters. One question that’s emerging about this earnings season is whether analysts were too pessimistic in lowering earnings expectations, or whether corporations are delivering stronger-than-expected results in a better-than-expected macro environment.

I think both are true.

On the analyst side, there hasn’t been adequate appreciation for the idea that the earnings recession likely started about a year ago, which I think implies that we’re nearing the bottom or already past it. Energy sector earnings have distorted the overall picture in the last year, with high commodity prices resulting in a profit surge that skewed results for the broad S&P 500. But when we strip away the energy sector’s contributions, we find that S&P 500 earnings have been contracting on an annual basis since Q2 2022. In short, forward estimates today don’t seem to be considering the possibility of an earnings recovery in the second half of the year.

Banks have also been a key driver in this quarter’s better-than-expected results (to date), but not in the way most investors expected in the wake of regional banking stress. The worst fears of a financial contagion did not come to fruition, and major banks have performed far better than anticipated. As a result, Q1 earnings
for Financials are now expected to be up +7.6% from the year-earlier period, a significant improvement from the +0.3% growth expected just one week ago.

The three most prominent players in the space – JPMorgan, Bank of America, and Citigroup – handily beat top- and bottom-line estimates. JPMorgan’s Q1 earnings, for instance, were up an impressive +52.4% from the same period last year on +24.8% higher revenues on record net-interest income. Earnings estimates for the June quarter have been increasing for these major banks as well, which I think investors should read as a significant positive surprise.

Remember, just one month ago many were questioning the health and stability of the banking sector.

A final observation I’d make about this earnings season is that operating margins appear to have turned the corner for the positive. The past year has posed many challenges for corporate profits, largely from rising labor costs and some companies’ limited ability to pass on rising input costs to consumers. Those pressures appear to be easing now, and there’s a good argument that margin pressures may have peaked in Q4 2022 (see chart below). This metric is critical, as operating margins are an important gauge of profitability and also a leading indicator for stocks.

But our early read is that earnings overall are shaping up to be far better-than-expected this quarter. In my view, analysts got too cautious in anticipating the fallout from bank stress, which to date has not materialized into much of an economic impact. But there have also been persistent expectations for a recession—which has yet to arrive—baked into estimates. When looking out at estimates for future quarters, the key question becomes: what happens if the U.S. avoids recession altogether?

Home Prices Tick Slightly Higher After Seven Months of Decline

The U.S. housing market has endured a soft patch for about a year, but February data signaled that a ‘bottoming’ may be underway. Following seven straight months of declines, the S&P CoreLogic Case-Shiller National Home Price Index rose 0.2% from January to February (see chart below).²

S&P Case-Shiller Home Price Index (% Change)

On a year-over-year basis, prices were up 2% in February. Part of the reason for price support likely stems from mortgage rates, which fell in December of last year and early in 2023. The markets’ expectation for a recession later this year combined with a likely ‘pause’ in rate hikes from the Federal Reserve eased pressure on long-duration Treasuries and also the 30-year fixed mortgage rate, which finished last week at 6.39% – down from a peak of over 7%. Another reason for the bump in home prices likely came from inventories that remain low, which has kept markets competitive, particularly in the East and South. Prospective buyers have been increasingly opting for new single-family houses versus existing homes, with sales of new houses jumping to an annual pace of 683,000 in March, the highest level in a year.

Trends in U.S. Shipping Signal Weakening Overall Demand

The Dow Jones Transportation Index has fallen about -10% from highs, an indicator we referenced in last week’s Steady Investor. The takeaway, in short, was that markets seemed to be anticipating a slowdown in shipping and freight, a possible sign of economic weakness or a recession ahead. Diesel gas prices may be telling the same story – wholesale diesel recently fell to $2.65 a gallon, a significant decline from $5.34 last summer. Benchmark diesel futures fell this week to $2.45 a gallon, a 15-month low. Last year, record diesel prices impacted everything from construction sites to goods sold at retail locations, and those higher costs may have dampened the appetite of many producers to ramp up in the new year. It’s also true that many stores and warehouses remain overstocked as a legacy of the goods-driven consumption boom, which is negatively impacting fuel demand. According to federal record-keepers, the impact on domestic demand was over -8% (year-over-year). The upshot to this story is that lower diesel costs may lure many producers back into the market, and encourage a rebound in manufacturing production.³

Another Labor Shortage in the U.S.

$42.5 billion in new government funding is earmarked to install, repair, and maintain broadband networks across the U.S., as part of President Biden’s infrastructure plan. Millions of American households still do not have access to fixed broadband, and the legislation meant to change that. The problem: there aren’t enough workers available to lay cable and repair wired broadband networks. According to the Fiber Broadband Association, an additional 205,000 “fiber splicers” – which is what the needed
broadband workers are called – will be needed through 2026 to complete all of the needed projects, which marks a nearly 50% increase from current levels. One potential solution to this labor shortage is for cellphone companies to provide more wireless internet service across rural areas, which would also qualify for the federal subsidies. But the longer-term issue with this approach is that wireless has lower capacity and speeds than fiber, which is likely to create problems as Americans use an increasing amount of data for everyday needs.\(^4\)

The S&P 500 Index is a well-known, unmanaged index of the prices of 500 large-company common stocks, mainly blue-chip stocks, selected by Standard & Poor’s. The S&P 500 Index assumes reinvestment of dividends but does not reflect advisory fees. The volatility of the benchmark may be materially different from the individual performance obtained by a specific investor. An investor cannot invest directly in an index.

The Russell 1000 Growth Index is a well-known, unmanaged index of the prices of 1000 large-company growth common stocks selected by Russell. The Russell 1000 Growth Index assumes reinvestment of dividends but does not reflect advisory fees. An investor cannot invest directly in an index. The volatility of the benchmark may be materially different from the individual performance obtained by a specific investor.

Nasdaq Composite Index is the market capitalization-weighted index of over 3,300 common equities listed on the Nasdaq stock exchange. The types of securities in the index include American depositary receipts, common stocks, real estate investment trusts (REITs) and tracking stocks, as well as limited partnership interests. The index includes all Nasdaq-listed stocks that are not derivatives, preferred shares, funds, exchange-traded funds (ETFs) or debenture securities. An investor cannot invest directly in an index. The volatility of the benchmark may be materially different from the individual performance obtained by a specific investor.

The Dow Jones Industrial Average measures the daily stock market movements of 30 U.S. publicly-traded companies listed on the NASDAQ or the New York Stock Exchange (NYSE). The 30 publicly-owned companies are considered leaders in the United States economy. An investor cannot directly invest in an index. The volatility of the benchmark may be materially different from the individual performance obtained by a specific investor.

The Bloomberg Global Aggregate Index is a flagship measure of global investment grade debt from twenty-four local currency markets. This multi-currency benchmark includes treasury, government-related, corporate and
securitized fixed-rate bonds from both developed and emerging markets issuers. An investor cannot invest directly in an index. The volatility of the benchmark may be materially different from the individual performance obtained by a specific investor.

The ICE Exchange-Listed Fixed & Adjustable Rate Preferred Securities Index is a modified market capitalization weighted index composed of preferred stock and securities that are functionally equivalent to preferred stock including, but not limited to, depositary preferred securities, perpetual subordinated debt and certain securities issued by banks and other financial institutions that are eligible for capital treatment with respect to such instruments akin to that received for issuance of straight preferred stock. An investor cannot invest directly in an index. The volatility of the benchmark may be materially different from the individual performance obtained by a specific investor.
